# Research Objective

## Objective

Development of power supply with

- Large current
- Fast response

## Approach

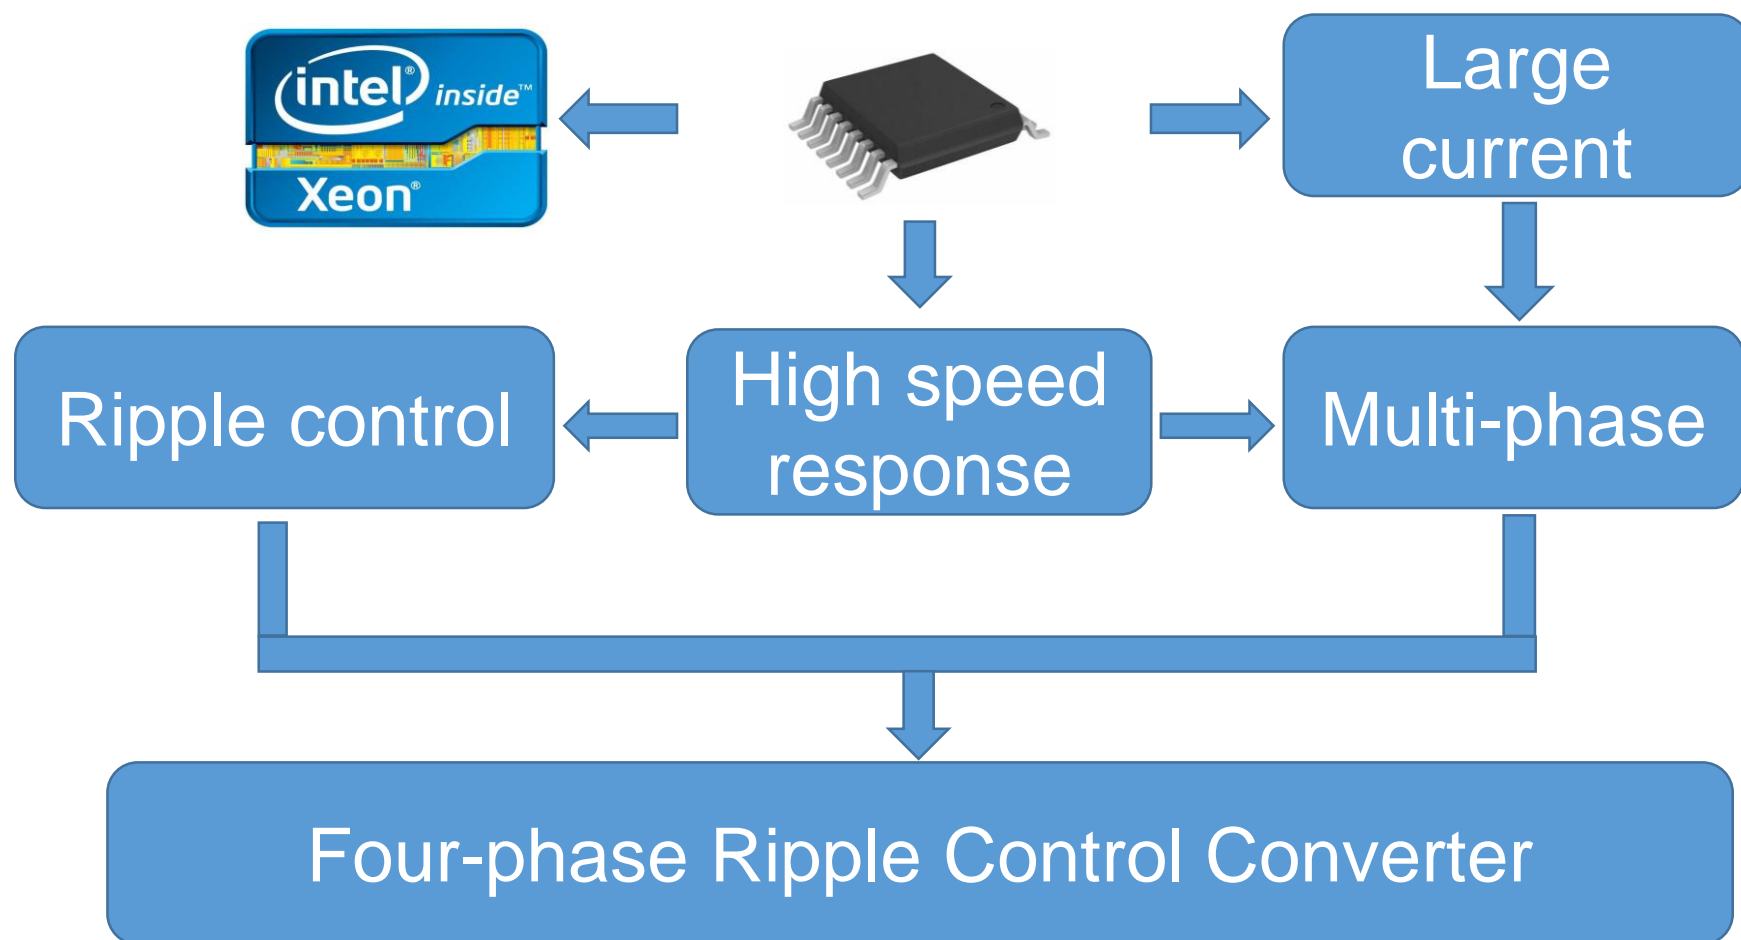

- Constant on-time for ripple control converter
- Make the power supply multi-phase

- Research background
- Constant on-time control
- Four-phase converter solution of PLL way
- Simulation result of PLL way
- Four-phase converter solution of Saw-tooth-wave circuit way
- Simulation result of Saw-tooth-wave way
- Conclusion

- Research background
- Constant on-time control
- four-phase converter solution of PLL way
- Simulation result of PLL way
- four-phase converter solution of Saw-tooth-wave circuit way
- Simulation result of Saw-tooth-wave way
- Conclusion

# Demand for Power Supply of Process

DC input	DC output	Max. output current	Max. output current step	Max. output current slew rate
12V	1.5V	120A	100A/us	930A/us

- **Constant on-time control**
- four-phase converter solution of PLL way
- Simulation result of PLL way
- four-phase converter solution of Saw-tooth-wave circuit way
- Simulation result of Saw-tooth-wave way
- Conclusion

# Merit of Constant on-time control

## Ripple Control

Hysteresis window control

Extremely fast response

No phase compensation

Frequency swings usually

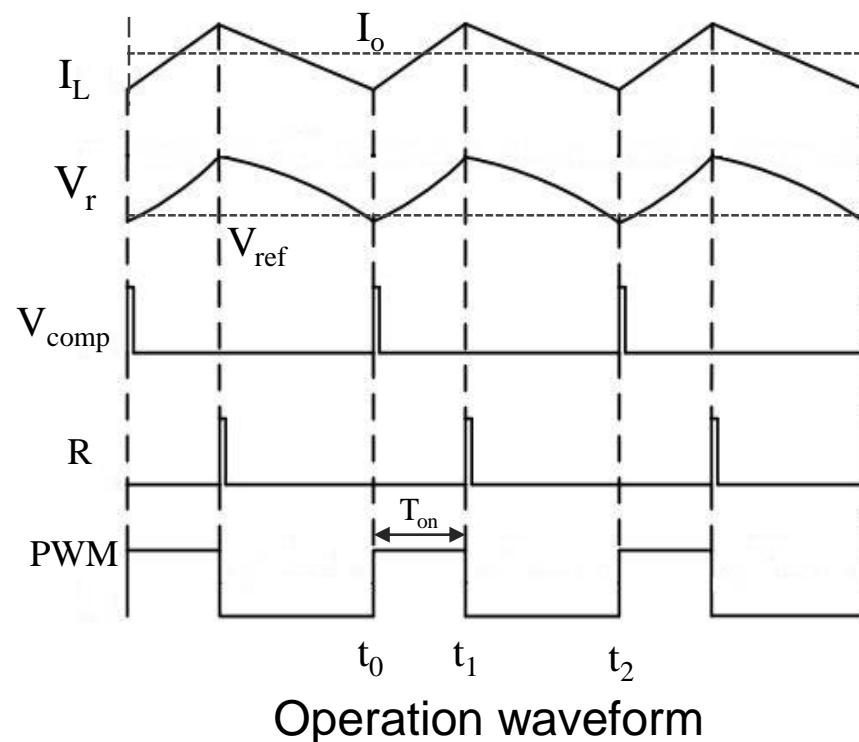

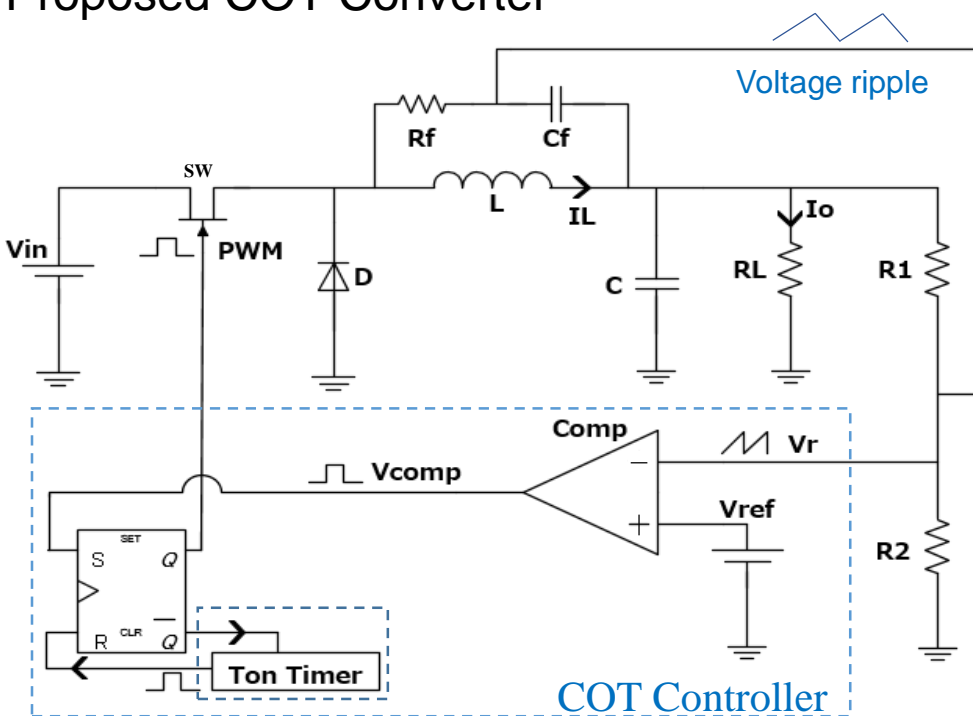

Constant on-time control

Frequency keeps stable

# Operation of Constant on-time control

## Proposed COT Converter

Constant Ton

No clock

Tracking PWM  
with PWM1 is  
demanded  
without clock

PMW1

PMW2

PMW3

PMW4

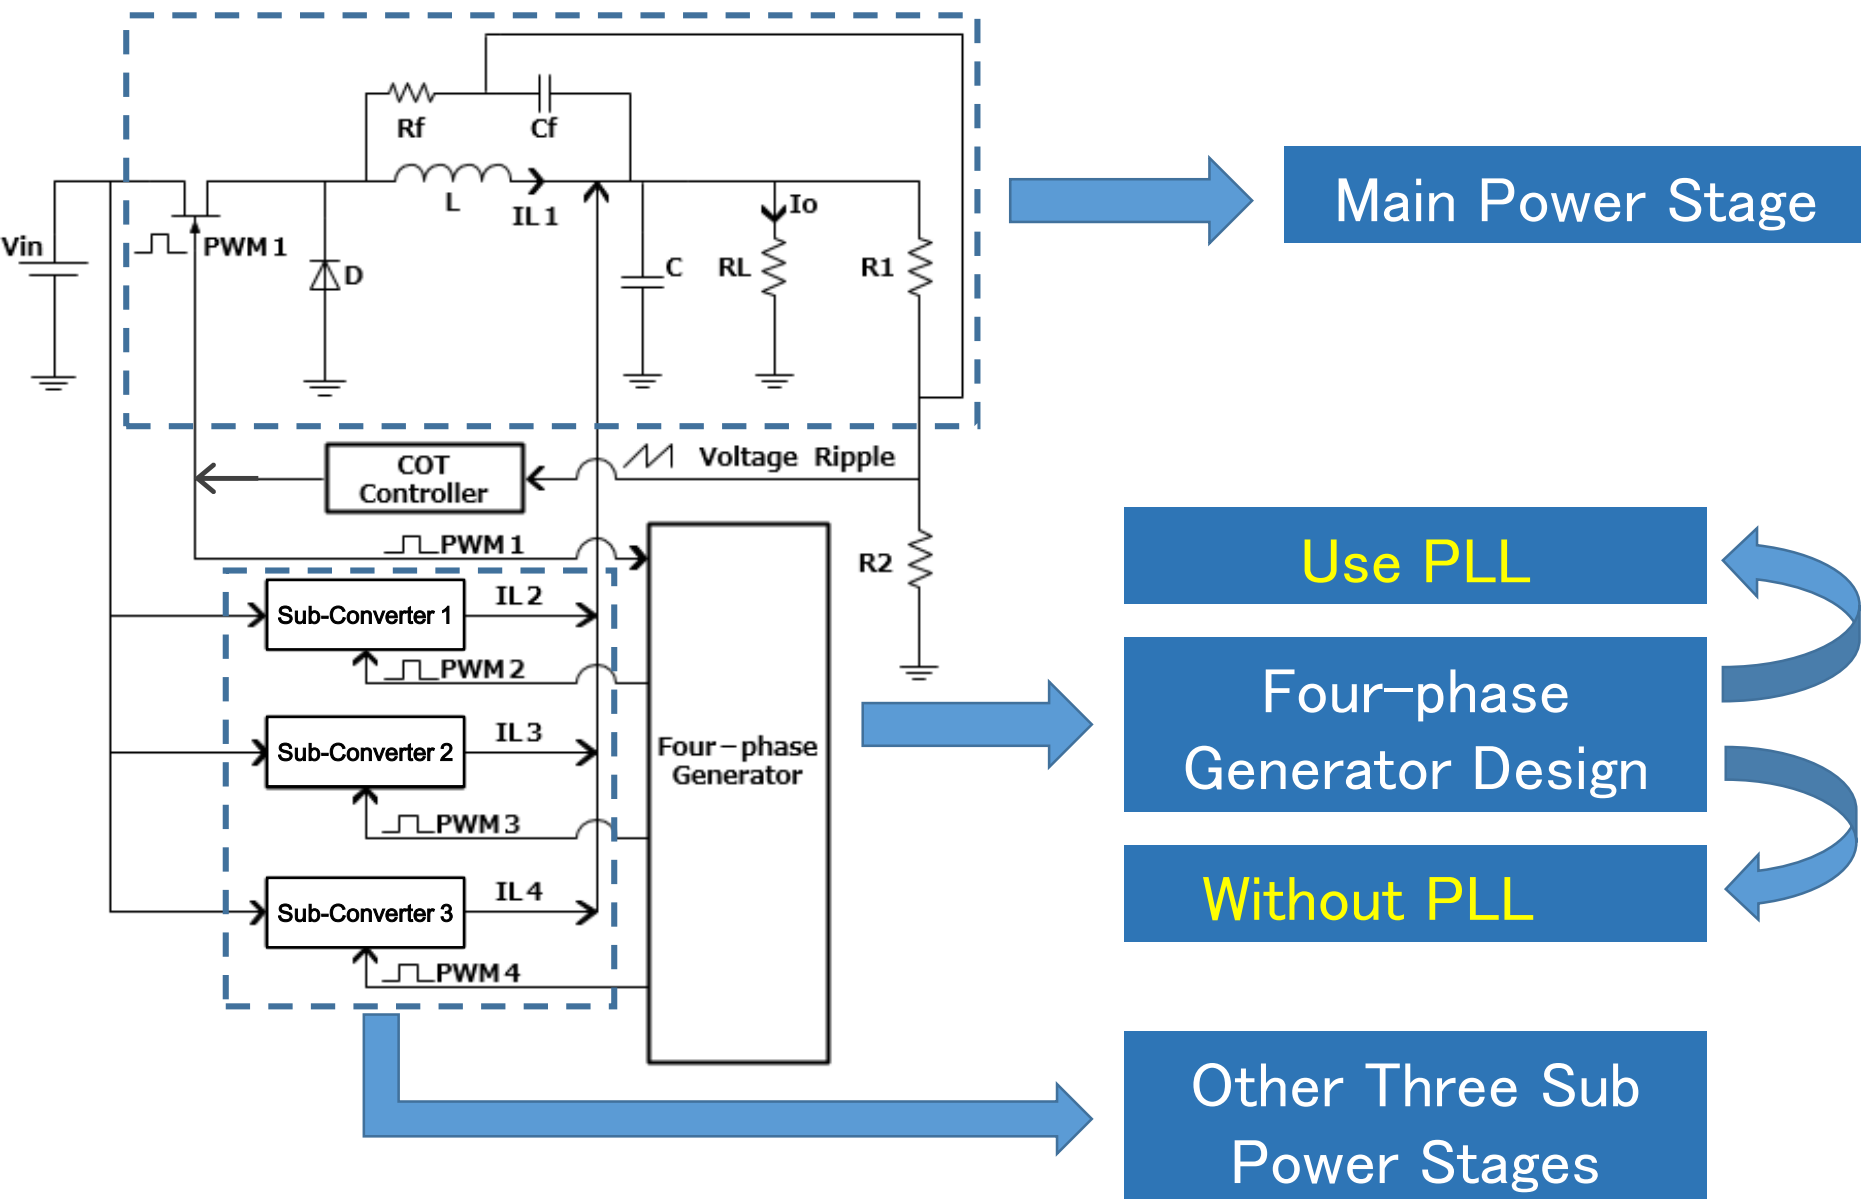

Stable  
frequency

Difficult to get  
multiphase

# Proposed Four-Phase Converter Solution

# Generation of Four-Phase PWM within PLL <sup>10</sup>

Use PLL circuit

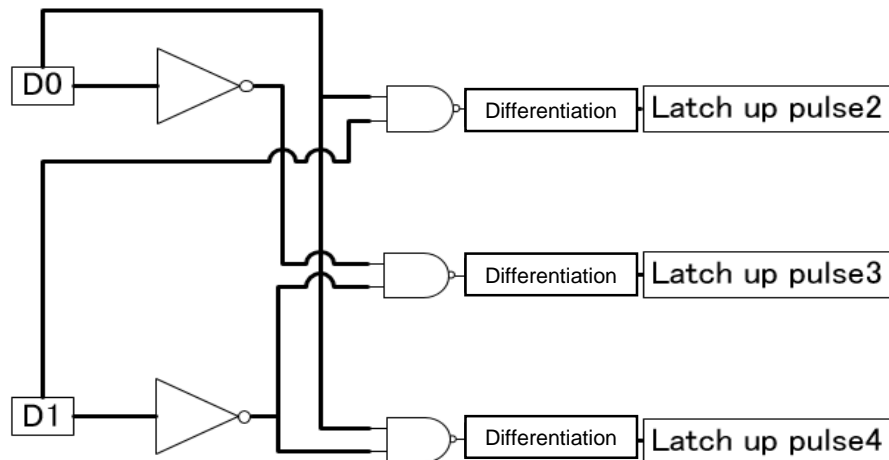

# Generation of Tracking PWM

## Operation waveform

Tracking PWM (D1) is generated

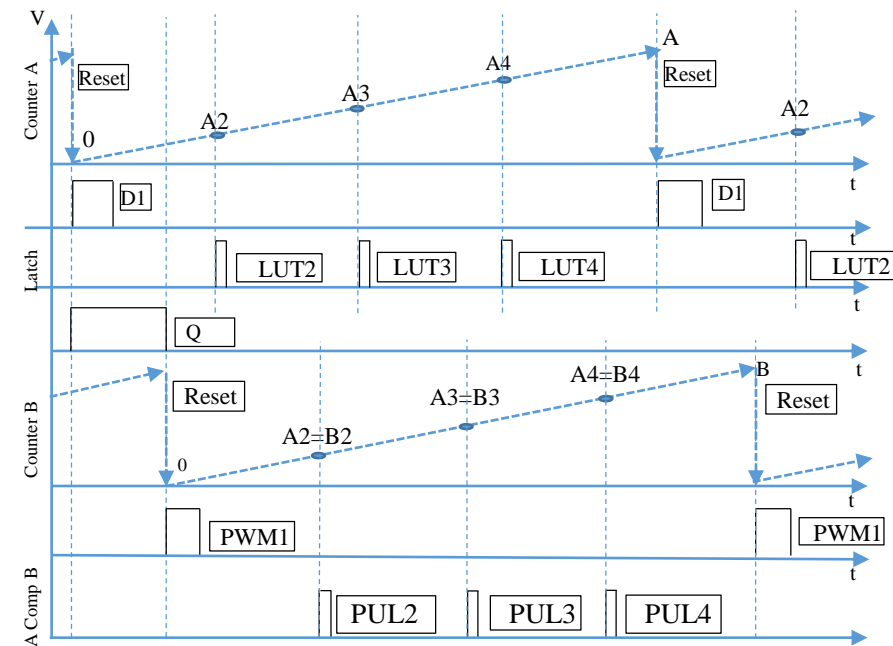

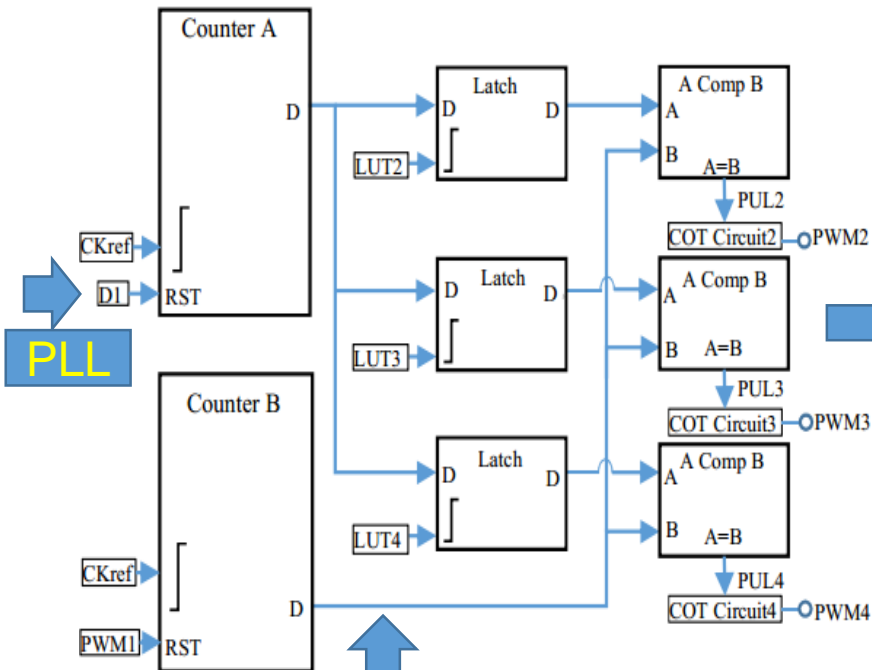

## Logic circuit

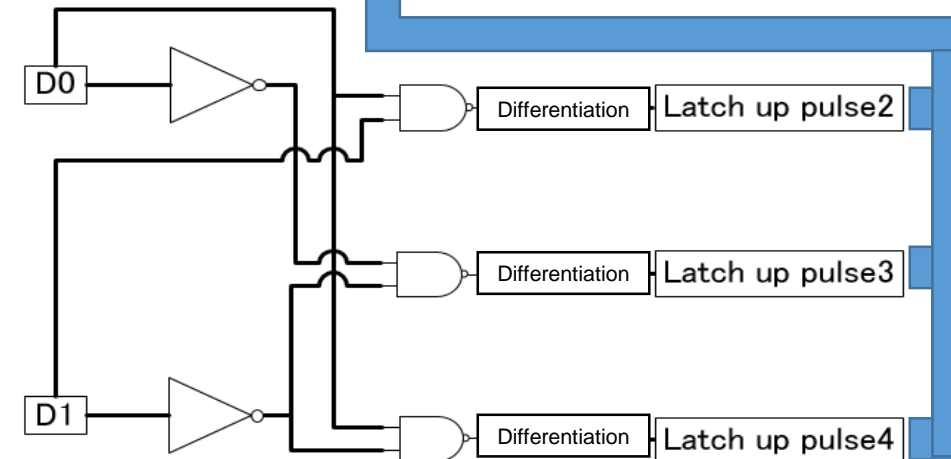

Three-phase pulse tracking with D1

# Generation of Four-phase PWM

## Digital multiphase PWM generator

## Three-phase pulse tracking with PWM1

- Constant on-time control
- four-phase converter solution of PLL way
- **Simulation result of PLL way**
- four-phase converter solution of Saw-tooth-wave circuit way
- Simulation result of Saw-tooth-wave way
- Conclusion

# Current Balance(Within PLL)

Current balance

Current balance is NOT good

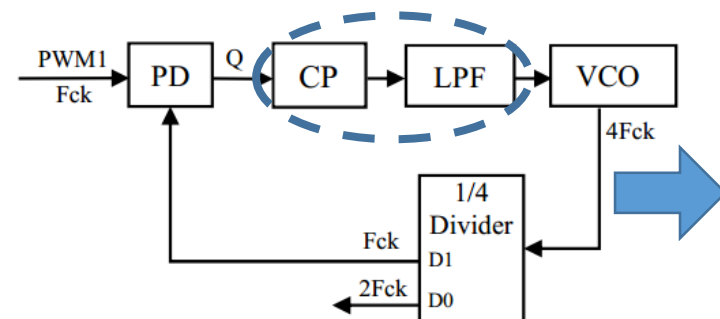

Large load transient response

Slow response  
to large load transient

Low pass filter inside  
PLL makes response slow

# Current Balance (without PLL)

$$I_{L1} = I_{L2} = I_{L3} = I_{L4}$$

$$\begin{aligned} \Delta I_{L1} &= I_{L1} - I_o/4 \\ &= |1.26 - 5.06/4| = 0.005A \end{aligned}$$

$$\delta = 0.005 / (5.06/4) \times 100\% = 0.39\%$$

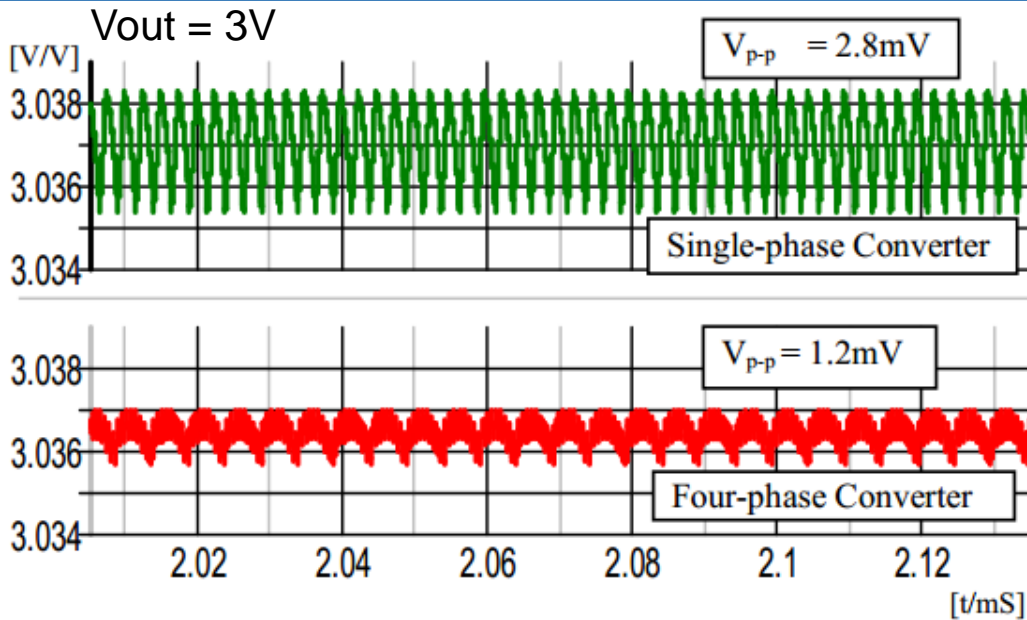

Good current balance

Large load current achieved

Good current balance during transient response

# Comparison (without PLL)

Static state characteristic

	Ripple peak to peak	Ripple range
$V_{out}$	57%off	under 1%

Dynamic load regulation

Transient response	Overload	Underload
Peak to Peak voltage	70%off	59%off
Recovery time	75%off	80%off

- Proposal of four-phase DC-DC converter with constant-on-time control
- Four-phase PWM generators   
Designed with digital and analog circuits
- Good current balance
- Large load current
- Low output voltage
- Fast response

Q:How many times did you do the simulation until the result coming out.

A: Actually, the current balance error changes by the on-time of PWM. So I did many the simulation for many times to find out the appropriate on-time in order to get the best current balance.

Q:What is the difference between convectional and two-phase converter.

A:Just like the result in the previous paper. Both voltage shoot and recovery time has become much better during the transient response.
