

# Time Domain Signal Processing Techniques and Their Applications

Haruo Kobayashi

*Gunma University*

## Advanced CMOS VLSI

- Low power-supply voltages
- Fast switching speeds

Much attention is being paid to  
Time domain analog signal processing  
In nano-CMOS technology era.

# Features of Time Domain Processing (1) <sup>3/21</sup>

- Dynamic range of time domain signal processing can be very wide.

Time continues indefinitely

Time flies like an arrow

# Features of Time Domain Processing (2) <sup>4/21</sup>

- Synchronization among clocks

Similar to gears

# Features of Time Domain Processing (3) <sup>5/21</sup>

## ● Ring oscillator

Möbius strip

- Time hold circuit

**Myth** : Time cannot be held.

**Truth**: It can be held.

- Time amplifier circuit

**Myth** : Time cannot be amplified.

**Truth**: It can be amplified.

# Trigger Circuit

7/21

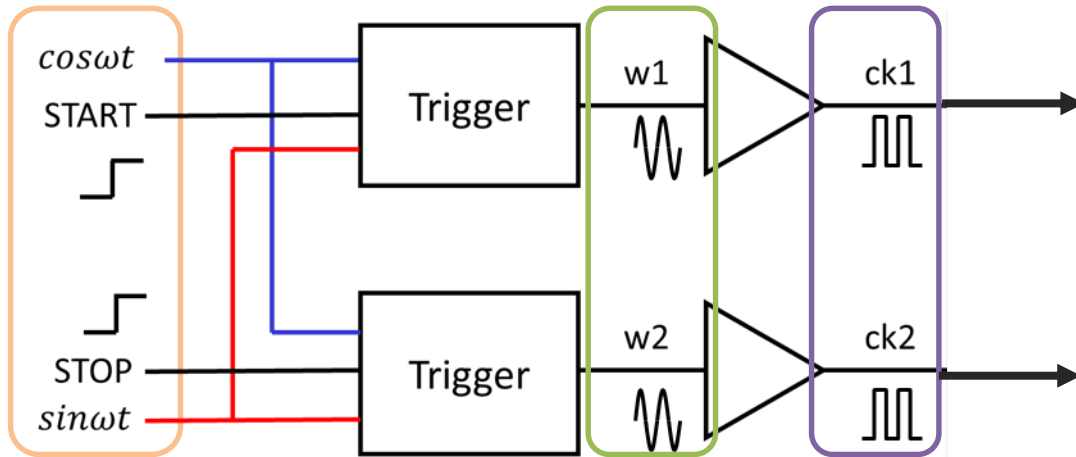

- Output starts to oscillate at rising timing edge of input

[1] M. Nelson (Tektronics)

"A New Technique for Low-Jitter Measurements Using Equivalent-Time Sampling Oscilloscope"

Automatic RF Techniques Group 56th Measurement (Dec. 2000)

# Time difference can be held !

In a sampling oscilloscope, a repetitive high-frequency waveform can be sampled with low-frequency sampling clock and reconstructed.

3 time-bases

- ① **Coherent** Sampling  
for **periodic** waveform
- ② **Sequential** Sampling  
for **repetitive** waveform, **w/o** pre-trigger function
- ③ **Random** Sampling  
for **repetitive** waveform, **w/** pre-trigger function

# Coherent Sampling

10/21

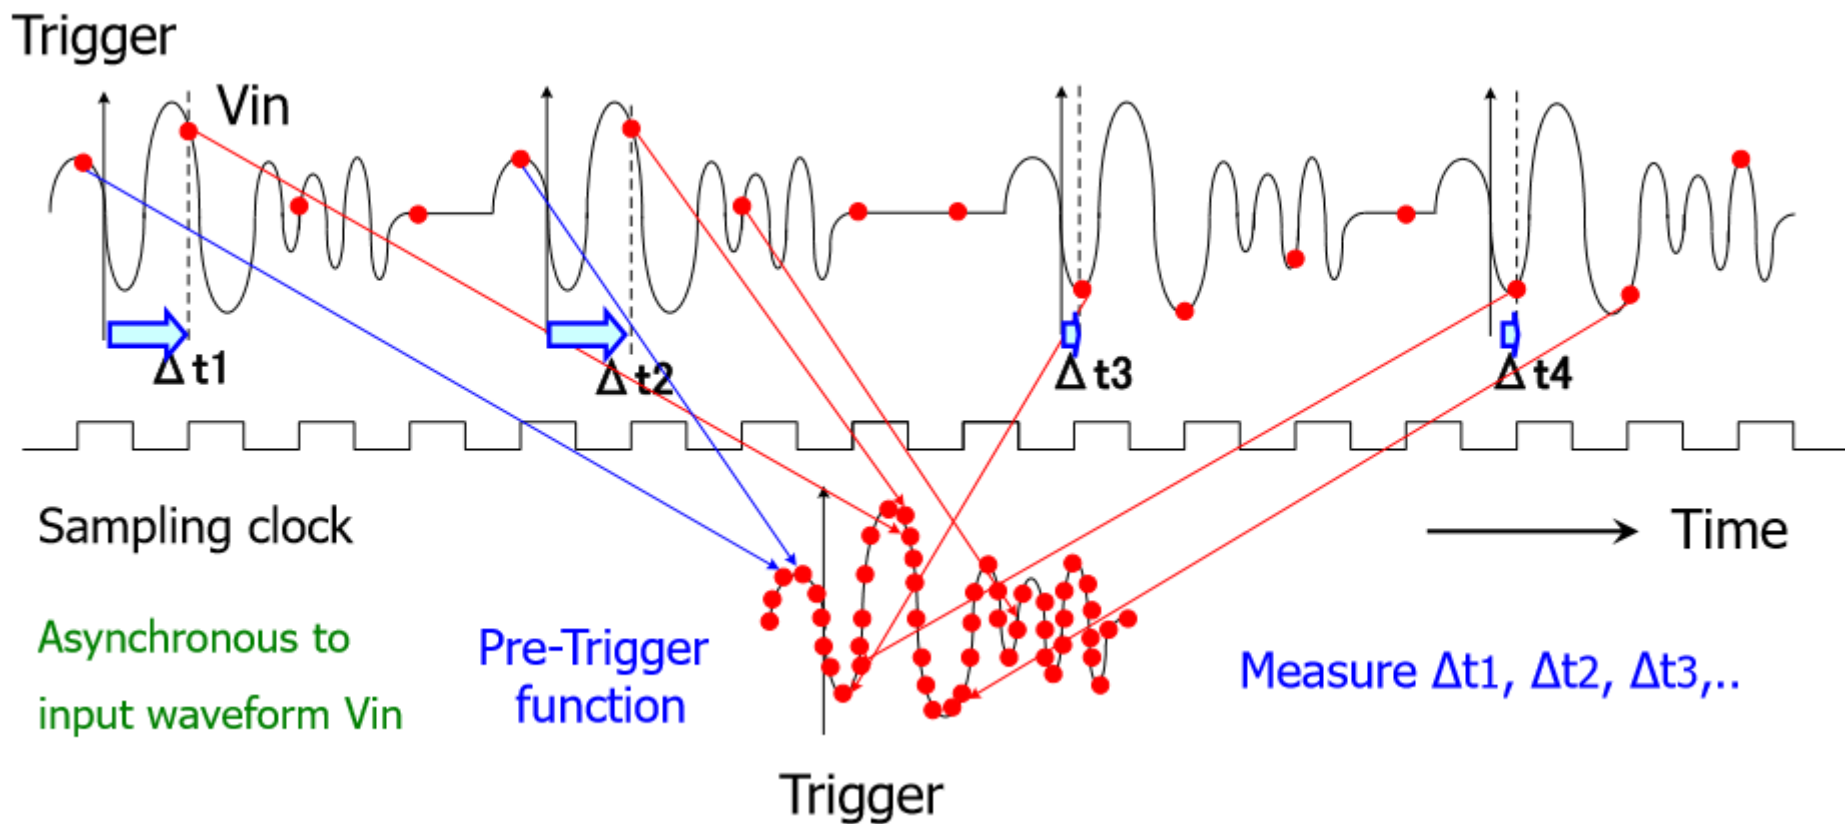

Finer time resolution than sampling clock period

# Sequential Sampling

11/21

# Random Sampling

# Waveform Missing Phenomena

Toothless waveform appears

# Waveform Missing Conditions

$$f_{CLK} \gg f_{sin} \quad f_{CLK} \approx \frac{1}{\alpha} f_{sin} \quad \left( \alpha = 1, \frac{1}{2}, \frac{1}{3}, \frac{2}{3}, \dots, \frac{1}{6}, \dots \right)$$

$$f_{CLK} \approx f_{sin}$$

Sampling points move little → Requires long time

$$T_{CLK} = ? \times T_{sig}$$

- [1] Y. Sasaki, Y. Zhao, A. Kuwana, H. Kobayashi,  
"Highly Efficient Waveform Acquisition Condition in Equivalent-Time Sampling System"  
27th IEEE Asian Test Symposium, Hefei, Anhui, China (Oct. 2018)

$$f_{CLK} = \varphi \times f_{sig}$$

$\varphi$  : Golden ratio ( = 1.6180339887... )

Sampling points disperse uniformly through measurement

# Time versus Phase with Optimal Sampling<sup>17/21</sup>

16 pt.

64 pt.

256 pt.

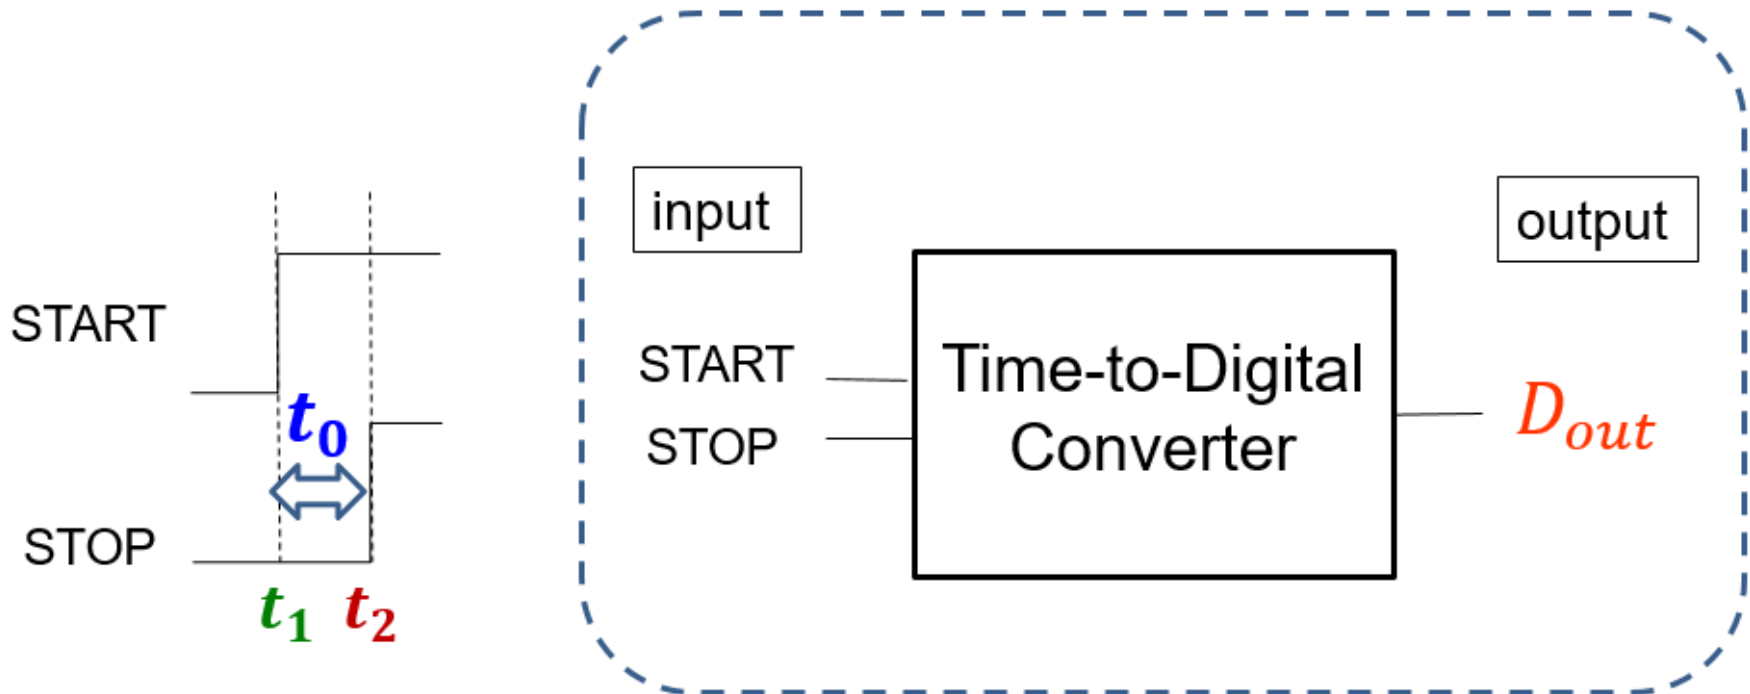

1024 pt.

**Radius:** Normalized time progress

**Phase:** Input sinewave phase

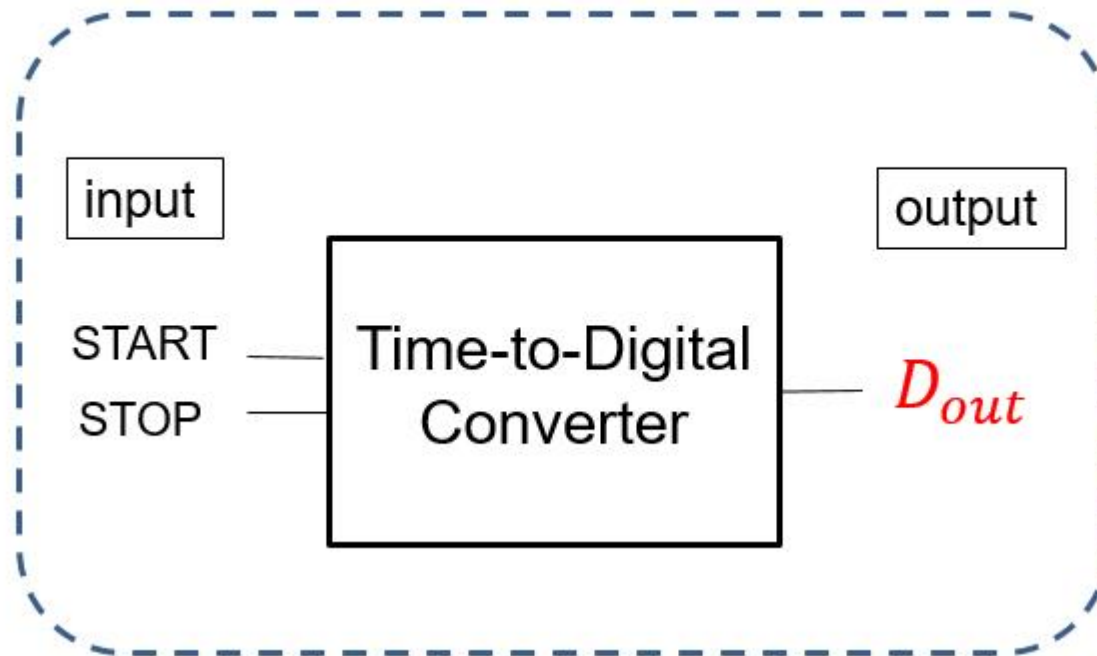

Dots are filled uniformly in Gaussian plane.

- Time-to-digital converter (TDC) measures **timing difference  $t_0$**  between  $t_1$ ,  $t_2$  as a **digital value  $D_{out}$**

# TDC Application Examples

19/21

Inter-vehicular distance measurement

Satellite distance measurement

TDC architectures have been inspired by ADC architectures

Flash TDC  Flash ADC

SAR TDC  SAR ADC

Integral-type TDC  Integral-type ADC

$\Delta\Sigma$  TDC   $\Delta\Sigma$  ADC

Slow but very fine time resolution

# Conclusion: Time is GOLD !!
